Visual Evidence

One observed moment

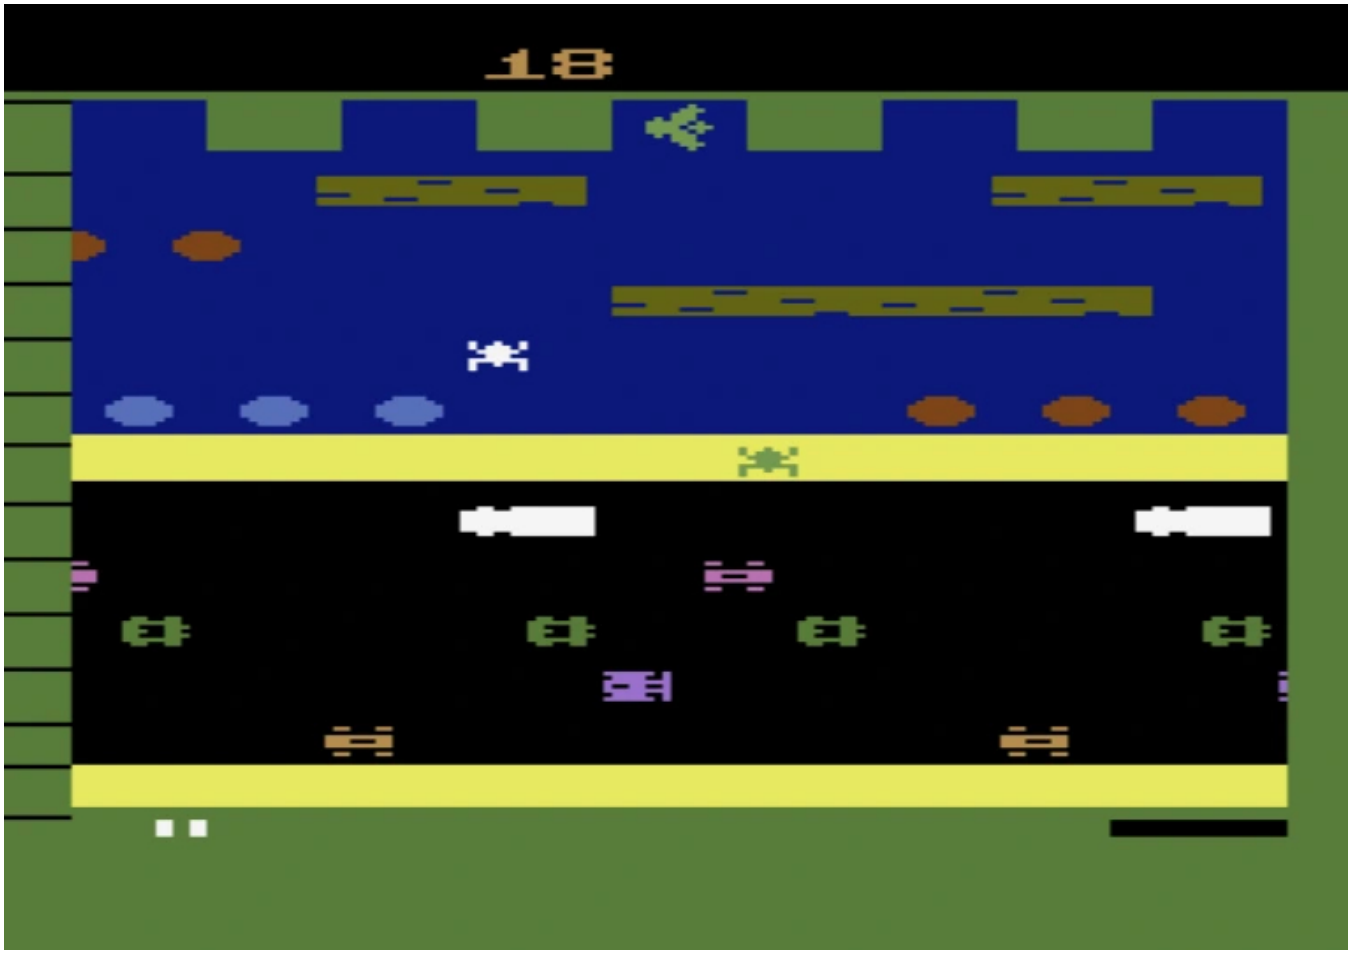

Image evidence prompt

Submit one original screenshot or still of your Case Study 1 Atari game. Caption it with the title, version or platform when known, the scene shown, and its source. A relevant image from your first case study may be reused.

Requirements and potential deductions

- The image shows the original scene used for this redesign. (up to -0.5 points)
- The caption identifies the selected Atari game, scene, and image source. (up to -0.5 points)

Caption: Frogger (Atari 2600). The scene shows the frog right before the river and a white-colored female frog. This is my own screenshot.

Visual Redesign

Improvement goal

Response prompt

Identify one visual problem in the original scene and explain the mood or player experience your redesign should support. Refer to a specific detail in the original image.

Requirements and potential deductions

- Identifies a visual problem using a specific detail from the original scene. (up to -0.75 points)
- Explains the intended mood or player experience of the redesign. (up to -0.75 points)

Submitted response

The white-colored female frog is actually supposed to be carried for bonus points; however, I don't believe the visuals make tha
easily understandable. The visual representation is simply just the normal frog sprite colored white. You could easily assume th
frog is an obstacle rather than a goal to go towards. You also can't tell how many you have collected. A redesign should suppo
player experience of taking on danger and risk to gain points, so the bonus point-boosting nature of the female frog should be r
obvious, along with how many you've collected.

Revised palette

Response prompt

List your proposed colors and their roles, including any neutrals. Explain why this palette size and a named color relationship suit your improvement goal, and how contrast makes an important element stand out. Color names or swatches are sufficient; exact color codes are optional.

Requirements and potential deductions

- Identifies the proposed colors and what each is used for. (up to -0.5 points)
- Justifies the palette size and a named color relationship using the improvement goal. (up to -0.75 points)
- Explains a contrast choice that makes an important element stand out. (up to -0.75 points)

Submitted response

Pink should signify bonus points. Since some of the cars are already pink, they should be redesigned to red to indicate danger.
Palette should be kept small and simple for a game as graphically and mechanically simple as this so that information is clearly
distinguished. Pink stands out from the blue of the river (and any other objects on screen). It is also commonly associated with
positivity. A bright red will also stand out from the black background of the road. It is also commonly associated with negativity
warnings.

Redesigned scene

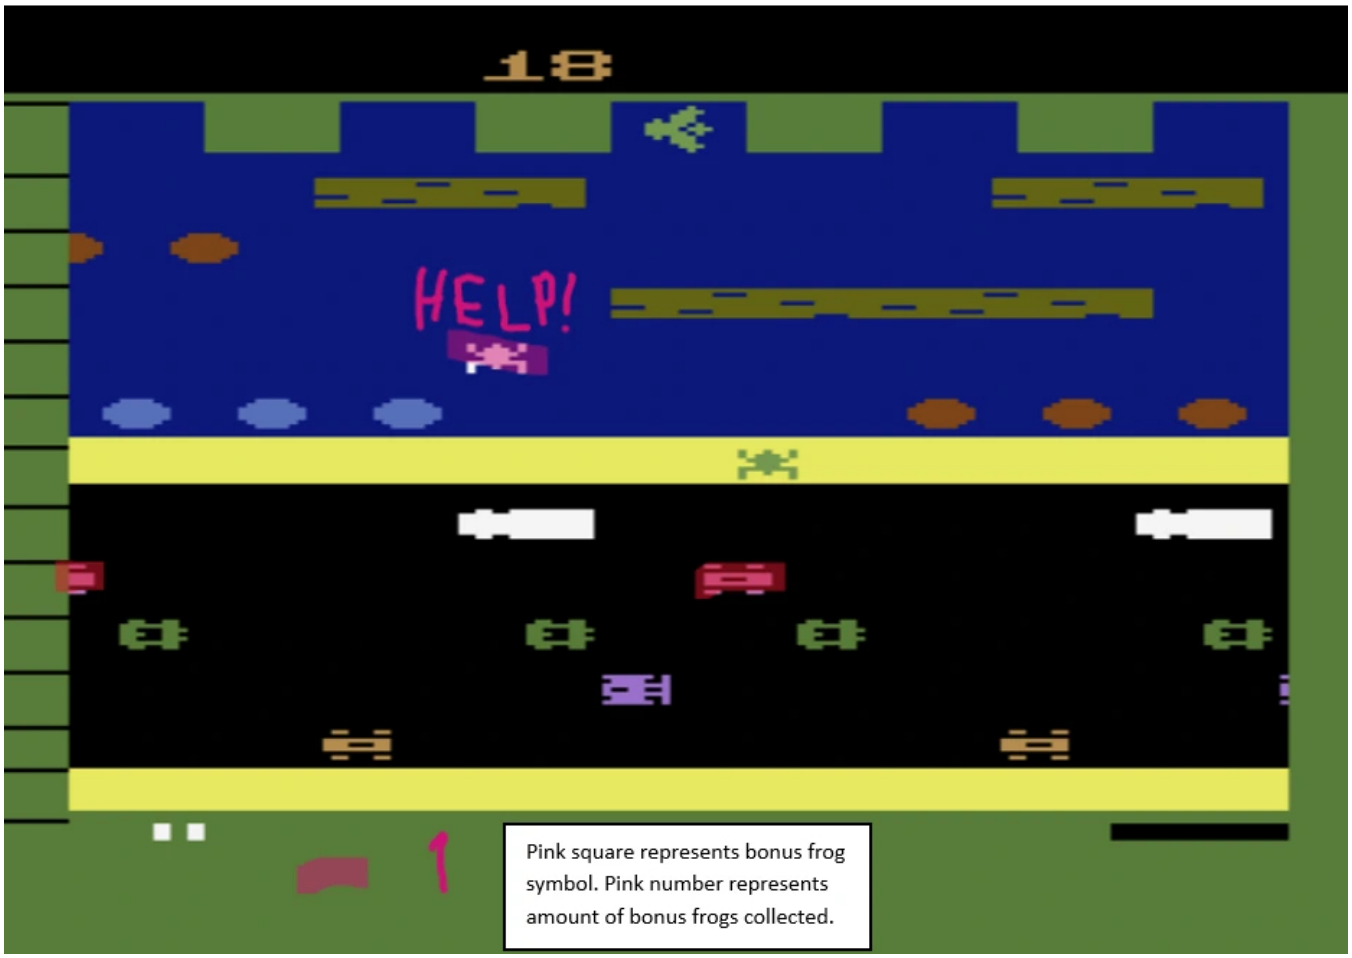

Image evidence prompt

Submit a colored sketch, annotated recoloring, or mockup of the same scene using your proposed palette. Include a gameplay element and an interface or state indicator. Keep an important state understandable without color alone, using a label, shape, or icon. Caption the image to identify the scene and your changes.

Requirements and potential deductions

- The redesign applies the proposed palette to the same scene's gameplay element and interface or state indicator. (up to -1.25 points)
- An important state has an understandable label, shape, or icon in addition to its color. (up to -1.25 points)

Caption: Bonus frog now pink with pink "HELP!" text above her. Some cars are now red to differentiate from bonus frog. Interface element shows symbol of bonus frog with a number counter next to it.

Look and feel decision

Response prompt

Explain one visual change beyond the palette, such as composition, interface layout, character shape, or an animation you would add. Connect it to a relevant Chapter 6 concept from vision, interface, ambience, or storytelling and explain its intended effect on the player. Describe motion in words if your sketch cannot show it.

Requirements and potential deductions

- Connects a specific visual change beyond the palette to a relevant Chapter 6 concept. (up to -0.75 points)
- Explains how that change would affect the player's experience. (up to -0.75 points)

Submitted response

The bonus frog should have a different shape to enhance the storytelling and visual communication that this is a different, spec frog. This different shape could be a frog facing the opposite way with a bow on top of her head.

Evaluate the redesign

Response prompt

Compare your redesign with the original scene. Explain how the revised visuals work together to address your improvement goal while keeping the game's core actions and rules. Refer to a specific difference visible in the two images.

Requirements and potential deductions

- Evaluates the combined effect of the revised visuals on the improvement goal using a specific before-and-after difference. (up to -0.75 points)
- Explains how the original core actions and rules remain intact. (up to -0.75 points)

Submitted response

The original visual was unclear in what the white frog meant. My redesign makes it clear using pink and "HELP!" text that this is an enemy or obstacle but something to be achieved. The interface also incentivizes and records these bonuses. Nothing has changed in terms of gameplay, but the bonuses are more obviously communicated and incentivized.
